

ABSTRACT OF THE DISCLOSURE

A point of use transfer switch array to simultaneously switch a plurality of loads from a first primary power source to a second power source in the event that the primary source is lost, becomes corrupted, or otherwise deviates from
5 predetermined specifications includes two logic modules, one for each power source, each logic module controlling the operation of a plurality of switches, one switch for each load. The switches may be coil-activated, double throw electro-mechanical relays that drop from one throw position to a second throw position upon a reduction of voltage across the relay coil.
